Wish List for ECC Scheme

We want ECC schemes that can jointly handle

- burst errors,
- symbol errors.

Wish List for ECC Scheme

We want ECC schemes that can jointly handle

- burst errors,
- symbol errors.

Moreover, the ECC scheme should also be able to handle

- burst erasures,
- symbol erasures.

Wish List for ECC Scheme

We want ECC schemes that can jointly handle

- burst errors,
- symbol errors.

Moreover, the ECC scheme should also be able to handle

- burst erasures,
- symbol erasures.

Finally, the ECC scheme should have

- low encoding complexity,
- low decoding complexity.

Concatenated Coding Scheme

In Particular: Product Coding Scheme

Disadvantages of Product Coding Scheme

Product coding schemes have many favorable aspects.

Disadvantages of Product Coding Scheme

Product coding schemes have many favorable aspects.

However:

- $\text{Rate}(\mathcal{C}_1) < 1$.
 \Rightarrow The **redundancy** of the coding scheme is **at least linear in m** .
- $\text{Rate}(\mathcal{C}_2) < 1$.
 \Rightarrow The **redundancy** of the coding scheme is **at least linear in n** .

- the linear $[mn, mk]$ code over F

Definition of Proposed Code

We define $\mathbb{C} = (\mathcal{C}, H_{\text{in}})$ to be

- the linear $[mn, mk]$ code over F
- which consists of all $m \times n$ matrices over F

$$\Gamma = \left(\begin{array}{c|c|c|c|c} \Gamma_0 & \Gamma_1 & \dots & \dots & \Gamma_{n-1} \\ \hline m \times 1 & m \times 1 & m \times 1 & m \times 1 & m \times 1 \end{array} \right)$$

Definition of Proposed Code

We define $\mathbb{C} = (\mathcal{C}, H_{\text{in}})$ to be

- the linear $[mn, mk]$ code over F
- which consists of all $m \times n$ matrices over F

$$\Gamma = \left(\begin{array}{c|c|c|c|c} \Gamma_0 & \Gamma_1 & \dots & \dots & \Gamma_{n-1} \\ \hline m \times 1 & m \times 1 & m \times 1 & m \times 1 & m \times 1 \end{array} \right)$$

such that each row in

$$Z = \left(\begin{array}{c|c|c|c|c} H_0 \Gamma_0 & H_1 \Gamma_1 & \dots & \dots & H_{n-1} \Gamma_{n-1} \\ \hline m \times 1 & m \times 1 & m \times 1 & m \times 1 & m \times 1 \end{array} \right)$$

is a codeword of \mathcal{C} .

**Proposed coding scheme:
Correction capabilities**

Correction Capability of Proposed Code

	error	erasure
block	τ columns in error	ρ columns erased
symbol	ϑ symbols in error	ϱ symbols erased

Correction Capability of Proposed Code

	error	erasure
block	τ columns in error	ρ columns erased
symbol	ϑ symbols in error	ϱ symbols erased

Theorem: There exists a decoder for the code \mathbb{C} that correctly recovers the transmitted array in the presence of the above error and erasure types (which may occur simultaneously), whenever

$$2\tau + \rho \leq d - 2$$

$$2\vartheta + \varrho \leq \delta - 1$$

Correction Capability of Proposed Code

	error	erasure
block	τ columns in error	ρ columns erased
symbol	ϑ symbols in error	ϱ symbols erased

Theorem: There exists a decoder for the code \mathbb{C} that correctly recovers the transmitted array in the presence of the above error and erasure types (which may occur simultaneously), whenever

$$2\tau + \rho \leq d - 2$$

$$2\vartheta + \varrho \leq \delta - 1$$

😊 **Surprisingly simple conditions!**

Proposed coding scheme:
Advantages

Advantages of Proposed Coding Scheme

- Multiplication by H_j^{-1} is like a rate-1 inner code.

Advantages of Proposed Coding Scheme

- Multiplication by H_j^{-1} is like a rate-1 inner code.
⇒ The **redundancy** of the coding scheme can be **independent of n** .

Advantages of Proposed Coding Scheme

Overall, we want to handle v symbol errors and q symbol erasures.

Advantages of Proposed Coding Scheme

Overall, we want to handle ϑ symbol errors and ϱ symbol erasures.

Product code:

code \mathcal{C}_2 needs to be designed such that it can handle the **worst case** where ϑ symbol errors and ϱ symbol erasures appear all in the same column.

Proposed code:

“same redundancy symbols” can be used to handle **overall** ϑ symbol errors and ϱ symbol erasures.

Advantages of Proposed Coding Scheme

Overall, we want to handle ϑ symbol errors and ϱ symbol erasures.

Product code:

code \mathcal{C}_2 needs to be designed such that it can handle the **worst case** where ϑ symbol errors and ϱ symbol erasures appear all in the same column.

Proposed code:

“same redundancy symbols” can be used to handle **overall** ϑ symbol errors and ϱ symbol erasures.

⇒ **“Price”** that is paid for this:

$$2\tau + \rho \leq d - 2$$

vs.

$$2\tau + \rho \leq d - 1$$

Advantages of Proposed Coding Scheme

- One can identify a **range of code parameters for \mathbb{C}** for which the resulting **redundancy improves upon the best known.**
(To the best of our knowledge.)

Advantages of Proposed Coding Scheme

- One can devise **efficient decoders** for combinations of block and symbol errors and erasures most relevant in practical applications.

Advantages of Proposed Coding Scheme

- One can devise **efficient decoders** for combinations of block and symbol errors and erasures most relevant in practical applications.
- In particular, these **decoders are more efficient** than a corresponding decoder for a suitably chosen Reed–Solomon code of length mn over F , assuming such a Reed–Solomon code exists in the first place.

Advantages of Proposed Coding Scheme

- One can devise **efficient decoders** for combinations of block and symbol errors and erasures most relevant in practical applications.
- In particular, these **decoders are more efficient** than a corresponding decoder for a suitably chosen Reed–Solomon code of length mn over F , assuming such a Reed–Solomon code exists in the first place.
- Finding **efficient decoders for the general case** is still an open problem.

Decoding

A Simplified Setup

A Simplified Setup: Error Model

- Encoded array has size $m \times n$.
- Up to t **burst errors** happen.

A Simplified Setup: Encoding

A Simplified Setup: Encoding

$m \times n'$ array of information symbols

A Simplified Setup: Encoding

A Simplified Setup: Encoding

Encoder_c

A Simplified Setup: Encoding

A Simplified Setup: Encoding

A Simplified Setup: Encoding

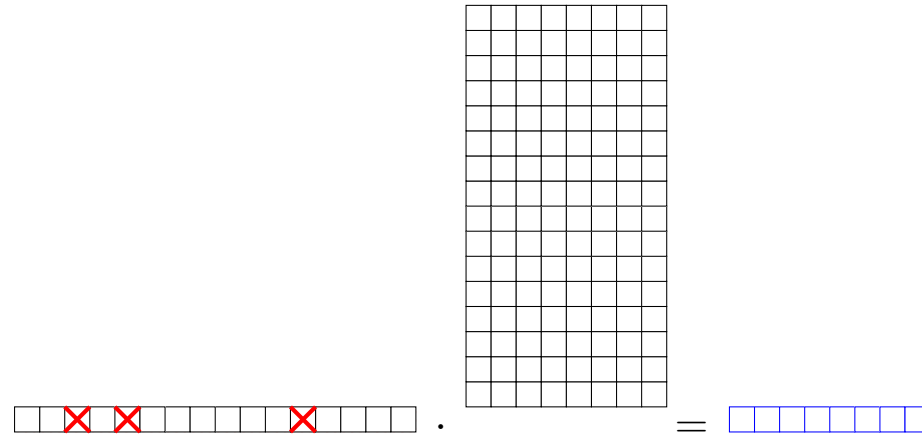

A Simplified Setup: Encoding

A Simplified Setup: Decoding

A Simplified Setup: Decoding

$$E \cdot H^T = S$$

We consider first the case $m = 1$.

A Simplified Setup: Decoding

$$\begin{bmatrix} \square & \times & \times & \square & \square & \square & \square & \times & \square & \square & \square & \square \end{bmatrix} \cdot \begin{bmatrix} \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \\ \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \end{bmatrix} = \begin{bmatrix} \square & \square & \square & \square & \square & \square & \square & \square & \square & \square \end{bmatrix}$$

$$E \cdot H^T = S$$

We consider first the case $m = 1$.

A necessary condition for being able to correct **(up to) t errors**:

$$\text{\#error patterns that we want to correct} \leq \text{\#different syndromes.}$$

A Simplified Setup: Decoding

$$E \cdot H^T = S$$

We consider first the case $m = 1$.

A necessary condition for being able to correct **(up to) t errors**:

$$\binom{n}{t} \cdot q^t \lesssim q^{n-k}.$$

A Simplified Setup: Decoding

Now we consider the case of general m .

A Simplified Setup: Decoding

The diagram illustrates the decoding process. It shows a grid representing an error matrix E with three red 'X' marks, a grid representing a parity-check matrix H^T , and a grid representing a syndrome S . The equation $E \cdot H^T = S$ is shown.

Now we consider the case of general m .

A necessary condition for being able to correct (up to) t burst errors:

$$\# \text{error patterns that we want to correct} \leq \# \text{different syndromes.}$$

A Simplified Setup: Decoding

Now we consider the case of general m .

A necessary condition for being able to correct **(up to) t burst errors**:

$$\binom{n}{t} \cdot q^{mt} \lesssim q^{m(n-k)}.$$

A Simplified Setup: Decoding

Now we consider the case of general m .

A necessary condition for being able to correct **(up to) t burst errors**:

$$t \lesssim \frac{m}{m+1} \cdot (n - k).$$

(Assumption: $n \approx q$ and t small.)

A Simplified Setup: Decoding

Now we consider the case of general m .

A necessary condition for being able to correct **(up to) t burst errors**:

$$t \leq \frac{1}{2} \cdot (n - k + \text{rank}(E) - 1)$$

(Assumption: MDS code.)

A Simplified Setup: Decoding

Now we consider the case of general m .

A necessary condition for being able to correct **(up to) t burst errors**:

$$t \leq \frac{1}{2} \cdot (n - k + \text{rank}(E) - 1) = \begin{cases} \frac{1}{2} \cdot (n - k) & (\text{rank}(E) = 1) \\ n - k - 1 & (\text{rank}(E) = t) \end{cases}.$$

(Assumption: \mathcal{C} is an MDS code.)

A Simplified Setup: Decoding

$$E \cdot H^T = S$$

Now we consider the case of general m .

Remarkable:

Decoding can be done by **Gaussian elimination**,
independently of the chosen code \mathcal{C} .

See [Metzner, Kapturowski, 1990] and [Haslach, Vinck, 2000/2001].

Proposed Coding Scheme: Encoding and Decoding

multiply by square matrix H_0^{-1}

Proposed Coding Scheme: Encoding and Decoding

multiply by square matrix H_1^{-1}

Proposed Coding Scheme: Encoding and Decoding

$m \times n$ array of codeword symbols

Proposed Coding Scheme: Encoding and Decoding

Proposed Coding Scheme: Encoding and Decoding

First decoding step: multiply the i -th column by H_i .

Proposed Coding Scheme: Encoding and Decoding

First decoding step: multiply the i -th column by H_i .

Decoder then takes advantage of **special structure of burst errors** in this modified array.

Conclusions

Conclusions

- **Motivation** for block and symbol errors / erasures.
- Discussed traditional and novel **ECC schemes** that can handle such errors / erasures with **low complexity** and compared their **advantages / disadvantages**.
- Finding **efficient decoders for the general case** is still an open problem.
- **More details**, in particular decoding schemes and comparison with other coding schemes, can be found in the paper available at **<http://arxiv.org/abs/1302.1931>**

Original Talk Topic

Connections between Techniques for Analyzing Finite State Channels and Techniques for Analyzing Graphical Models

- Theorems 26 and Corollary 27 in
P. O. Vontobel, “[The Bethe permanent of a non-negative matrix,](#)”
IEEE Trans. Inf. Theory, vol. 59, no. 3, pp. 1866–1901, Mar. 2013.

- Theorem 8 and Corollary 9 in
H. D. Pfister and P. O. Vontobel, “[On the relevance of graph covers and zeta functions for the analysis of SPA decoding of cycle codes,](#)” Proc. ISIT 2013.

Optimization Problem

$$\max_{\{\mu_i, p_{ij}\}} f(\{\mu_i, p_{ij}\})$$

$$f(\{\mu_i, p_{ij}\}) = - \sum_{(i,j) \in \mathcal{B}} \mu_i \cdot p_{ij} \cdot \log(p_{ij})$$

\mathcal{S} : state alphabet

$\{\mu_i\}$: stationary state probabilities

\mathcal{B} : branch alphabet

$\{p_{ij}\}$: transition probabilities

Optimization Problem

$$\max_{\{\mu_i, p_{ij}\}} f(\{\mu_i, p_{ij}\})$$

$$f(\{\mu_i, p_{ij}\}) = - \sum_{(i,j) \in \mathcal{B}} \mu_i \cdot p_{ij} \cdot \log(p_{ij}) + \sum_{(i,j) \in \mathcal{B}} \mu_i \cdot p_{ij} \cdot T_{ij}$$

\mathcal{S} : state alphabet

$\{\mu_i\}$: stationary state probabilities

\mathcal{B} : branch alphabet

$\{p_{ij}\}$: transition probabilities

$\{T_{ij}\}$: branch weights

Solution of this Optimization Problem

Definitions:

- “Noisy adjacency matrix” \mathbf{A} with $A_{ij} = \begin{cases} e^{T_{ij}} & \text{if } (i, j) \in \mathcal{B} \\ 0 & \text{otherwise} \end{cases}$.
- Let ρ be the maximal (real) eigenvalue of \mathbf{A} .
- Let β^T and γ be the corresponding left and right eigenvectors.

Then:

$$p_{ij}^* = \frac{\gamma_j}{\gamma_i} \cdot \frac{A_{ij}}{\rho} \quad (i, j) \in \mathcal{B},$$

$$\mu_i^* \propto \beta_i \cdot \gamma_i \quad i \in \mathcal{S},$$

$$f(\{\mu_i^*, p_{ij}^*\}) = \log(\rho).$$

This and similar problems were solved in, e.g., [Justesen, Høholdt, 1984], [Khayrallah, Neuhoff, 1996], [V., Kavčić, Arnold, Loeliger, 2008].

An aerial night view of a city skyline, likely Hong Kong, featuring numerous illuminated skyscrapers and a body of water. The text "Thank you!" is overlaid in the upper left quadrant.

Thank you!
