Simulate a Source through a Channel

- How much information is needed to simulate a source through a given channel?
- Called the channel resolvability problem.
- It was studied by Han-Verdú in 1993, but a similar simulation problem was first studied by Wyner in 1975.

Channel Resolvability

- M_n is uniformly distributed over $[e^{nR}] := \{1, \dots, e^{nR}\}.$
- An (n, R) code $f_n : [e^{nR}] \to \mathcal{X}^n$.
- The output distribution:

$$Q_{Y^n}(y^n) := e^{-nR} \sum_{m \in [e^{nR}]} P_{Y|X}^{\otimes n}(y^n | f_n(m)).$$
(1)

• We want Q_{Y^n} approximates a target $P_Y^{\otimes n}$.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Relative Entropy and Rényi Divergence

• The Rényi divergence of order $q \ge 0$ is

$$D_q(Q||P) := \frac{1}{q-1} \log \sum_{x \in \mathcal{X}} Q(x)^q P(x)^{1-q}.$$

• The relative entropy (Kullback-Leibler divergence) is a special case:

$$\lim_{q \to 1} D_q(Q \| P) = D(Q \| P) := \sum_{x \in \mathcal{X}} Q(x) \log \frac{Q(x)}{P(x)}.$$

The conditional version:

$$D_q(Q_{Y|X} \| P_{Y|X} | Q_X) := D_q(Q_X Q_{Y|X} \| Q_X P_{Y|X}).$$

• Rényi divergence is nondecreasing in its order.

| Lei Yu | (Nankai) |
|--------|----------|
|--------|----------|

- We minimize $D_q(Q_{Y^n} || P_Y^{\otimes n})$ over all (n, R) codes f_n .
- The q-Rényi resolvability rate is defined as

$$\mathbf{R}_q := \inf\{R : D_q(Q_{Y^n} \| P_Y^{\otimes n}) \to 0\}.$$

What is R_q ?

| Lei Yu | (Nankai) |
|--------|----------|
|--------|----------|

• Define $\mathcal{P}(P_{Y|X}, P_Y) := \{P_X : \sum_x P_{Y|X}(\cdot|x)P_X(x) = P_Y\}.$

Theorem ([Han-Verdú'93, Hayashi'06,'11]) For q = 1 (relative entropy),

$$\mathbf{R}_1 = \min_{P_X \in \mathcal{P}(P_Y|_X, P_Y)} I(X; Y).$$

- Converse: standard IT techniques.
- Achievability: soft-covering lemma [Wyner'75].

イロン イヨン イヨン イヨン

Soft-covering Lemma

- Let $\mathcal{C} = \{X^n(m)\}_{m \in [e^{nR}]}$ with $X^n(m) \sim Q_X^{\otimes n}, m \in [e^{nR}]$ drawn independently.
- Randomly and uniformly choose one codeword from C.
- The output distribution:

$$Q_{Y^n|\mathcal{C}}(y^n|\mathcal{C}) := e^{-nR} \sum_{m \in [e^{nR}]} P_{Y|X}^{\otimes n}(y^n|X^n(m)).$$
⁽²⁾

Lemma ([Wyner'75]) If R > I(X; Y), then $D(Q_{Y^n|\mathcal{C}} || P_Y^{\otimes n} | Q_{\mathcal{C}}) \to 0.$

Theorem

For $q \in [0,\infty]$, we have

$$\mathbf{R}_q = \Gamma_q(P_{Y|X}, P_Y),\tag{3}$$

where

$$\Gamma_q(P_{Y|X}, P_Y) := \begin{cases} \min_{\substack{P_X \in \mathcal{P}(P_{Y|X}, P_Y) \\ P_X \in \mathcal{P}(P_{Y|X}, P_Y) \\ min_{\substack{P_X \in \mathcal{P}(P_{Y|X}, P_Y) \\ 0, \\ 0, \\ q = 0. \\ \end{cases}} \mathbb{E}_{P_X} [D_q(P_{Y|X} \| P_Y)], \quad q \in (1, \infty] \\ q \in (0, 1] \\ q = 0. \end{cases}$$

Typical Code is Optimal

- Let $C = \{X^n(m)\}_{m \in [e^{nR}]}$ with $X^n(m) \sim P_X^{\otimes n}(\cdot | \mathcal{T}_{\epsilon}^{(n)}(P_X)), m \in [e^{nR}]$ drawn independently, where $\mathcal{T}_{\epsilon}^{(n)}(P_X)$ is the ϵ -typical set.
- Randomly and uniformly choose one codeword from C.
- The output distribution:

$$Q_{Y^n|\mathcal{C}}(y^n|\mathcal{C}) := e^{-nR} \sum_{m \in [e^{nR}]} P_{Y|X}^{\otimes n}(y^n|X^n(m)).$$
(4)

$$D_{q}(Q_{Y^{n}} || P_{Y}^{\otimes n}) = \frac{1}{q-1} \log \left(\sum_{\substack{y^{n} \in \mathcal{T}_{\epsilon}^{(n)}(Q_{Y}) \\ + \sum_{\substack{y^{n} \notin \mathcal{T}_{\epsilon}^{(n)}(Q_{Y})}} Q(y^{n})^{q} P(y^{n})^{1-q} \right).$$

• To reduce $D_q(Q_{Y^n} || P_Y^{\otimes n})$, the tail part should be as small as possible—truncation to typical sets!

What if $R > \Gamma_q(P_{Y|X}, P_Y)$?

Theorem (Exponential Behavior)

Given $q \in (0, \infty)$, if $R > \Gamma_q(P_{Y|X}, P_Y)$, then there exists a sequence of typical codes such that $D_q(Q_{Y^n} || P_Y^{\otimes n})$ decays at least exponentially fast.

Characterize exact exponent?—Difficult!

Theorem (Exponential Behavior of i.i.d. Codes)

For the i.i.d. code, if the rate $R > D_q(P_{Y|X} || P_Y | P_X)$, then we have

$$\lim_{n \to \infty} -\frac{1}{n} \log D_q(Q_{Y^n | \mathcal{C}_n} \| P_Y^{\otimes n} | P_{\mathcal{C}_n}) = \begin{cases} \min\{\gamma(2), \gamma(q)\}, & q \in (2, \infty) \\ \max_{t \in [q, 2]} \gamma(t), & q \in (1, 2] \\ \max_{t \in [1, 2]} \gamma(t), & q \in (0, 1] \end{cases},$$
(5)

where $\gamma(q) := (q-1)(R - D_q(P_{Y|X} || P_Y | P_X)).$

17/36

What if $R < \Gamma_q(P_{Y|X}, P_Y)$?

Theorem (Linear Behavior) • For $q \in [1,\infty]$, $\lim_{n \to \infty} \frac{1}{n} \inf_{f:[e^{nR}] \to \mathcal{X}^n} D_q(Q_{Y^n} \| P_Y^{\otimes n})$ $= \min_{Q_X} \max\{\mathbb{E}_{Q_X}[D_q(P_{Y|X} \| P_Y)] - R,$ $\max_{Q_{Y|X}} -q' D(Q_{Y|X} \| P_{Y|X} | Q_X) + D(Q_Y \| P_Y) \}.$ (6)**2** For $q \in (0, 1)$, $\lim_{n \to \infty} \frac{1}{n} \inf_{f:[e^{nR}] \to \mathcal{X}^n} D_q(Q_{Y^n} \| P_Y^{\otimes n})$ $= \min_{Q_{XY}} \max\{-q' D(Q_{Y|X} \| P_{Y|X} | Q_X) + D(Q_{Y|X} \| P_Y | Q_X) - R,$ $-q'D(Q_{Y|X}||P_{Y|X}||Q_X) + D(Q_Y||P_Y)\}.$

Here, $q' := \frac{q}{q-1}$ is the Holder conjugate of q.

Key Lemma

Constant composition codes: Let $C = \{X^n(m)\}_{m \in [e^{nR}]}$ with $X^n(m) \sim \text{Unif}(\mathcal{T}(T_X)), m \in [e^{nR}]$ drawn independently, where $\mathcal{T}(T_X)$ is the type class w.r.t. T_X .

Lemma (Strong Packing-Covering Lemma)

Given T_X , R > 0, and any $\epsilon > 0$, with high probability it holds that

$$|\mathcal{T}_{T_X|Y}(y^n) \cap \mathcal{C}| \in \frac{e^{nR}|\mathcal{T}_{T_XY}|}{|\mathcal{T}_{T_X}||\mathcal{T}_{T_Y}|} (1 \pm e^{-n\epsilon/3}) = e^{n(R-I_T(X;Y) + o(1))}$$

for all $T_{Y|X}$ s.t. $I_T(X;Y) \leq R - \epsilon$, and

$$0 \le |\mathcal{T}_{T_{X|Y}}(y^n) \cap \mathcal{C}| \le e^{n\epsilon}$$

for all $T_{Y|X}$ s.t. $I_T(X;Y) > R - \epsilon$.

Hypercontractivity

• Let $(X, Y) \sim P_{XY} = \text{DSBS}(\epsilon)$, i.e., $X \sim \text{Bern}(1/2)$ and $Y|X \sim \text{BSC}(\epsilon)$.

• Let
$$(X^n, Y^n)$$
 be n i.i.d. copies of (X, Y) .

• Denote $P_{X|Y}^{\otimes n}(f)(y^n) = \mathbb{E}[f(X^n)|Y^n = y^n].$

| Theorem ([Bonami '70][Beckner '75]) | |
|--|-----|
| For $q \geq 1$ and $p \geq 1 + (1 - 2\epsilon)^2(q - 1)$, | |
| $\ P_{X Y}^{\otimes n}(f)\ _q \le \ f\ _p, \forall f \ge 0,$ | (8) |
| and for $q \leq 1$ and $p \leq 1 + (1 - 2\epsilon)^2(q - 1)$, | |
| $\ P_{X Y}^{\otimes n}(f)\ _q \ge \ f\ _p, \forall f \ge 0.$ | (9) |

| Lei Yu (Nankai | ai) |
|----------------|-----|
|----------------|-----|

Theorem ([Y. 2024])

For q > p > 1,

$$\|P_{X|Y}^{\otimes n}(f)\|_{q} \ge e^{-nH_{q}(\epsilon)/p'} \|f\|_{p}, \forall f \ge 0,$$
(10)

and for 0 and <math>q < p.

$$\|P_{X|Y}^{\otimes n}(f)\|_{q} \leq e^{-nH_{p}(\epsilon)/p'} \|f\|_{p}, \forall f \geq 0,$$
(11)

where $p' := \frac{p}{p-1}$ is the Holder conjugate of p. The exponents above cannot be further improved.

• The special case of (10) with p = q was first proven by Samorodnitsky 2022.

• If we write $f = \frac{\mathrm{d}Q_X}{\mathrm{d}P_X}$, then

$$\log \|f\|_{p} = \frac{1}{p'} D_{p}(Q_{X} \| P_{X}),$$
$$\log \|P_{X|Y}(f)\|_{q} = \frac{1}{q'} D_{q}(Q_{Y} \| P_{Y}),$$

where $Q_Y := Q_X \circ P_{Y|X}$.

• Connecting Rényi resolvability and anti-contractivity.

イロト イヨト イヨト イヨト

Wyner's Common Information

- M_n is uniformly distributed over $\mathcal{M}_n = [e^{nR}]$
- An (n, R)-synthesis code consists of $(Q_{X^n|M_n}, Q_{Y^n|M_n})$.
- The induced distribution is

$$Q_{X^n Y^n}(x^n, y^n) := \frac{1}{|\mathcal{M}_n|} \sum_{m \in \mathcal{M}_n} Q_{X^n | M_n}(x^n | m) Q_{Y^n | M_n}(y^n | m)$$

Goal:

$$Q_{X^nY^n} \approx P_{XY}^{\otimes n}$$
 (target distribution)

向下 イヨト イヨト

- In 1975, Wyner used normalized relative entropy $\frac{1}{n}D(Q_{X^nY^n}||P_{XY}^{\otimes n})$ to measure the "distance" between $Q_{X^nY^n}$ and $P_{XY}^{\otimes n}$.
- He showed the minimum rate such that this "distance" vanishes is

$$C_{\mathbf{W}} := \min_{Q_W Q_X | W Q_Y | W \colon Q_X Y = P_{XY}} I_Q(XY; W).$$

• The same result still holds for $D(Q_{X^nY^n} || P_{XY}^{\otimes n})$ [Hayashi 2006].

Rényi Common Information

Define Rényi common information $C_q := \inf \{ R : D_q(Q_{X^nY^n} || P_{XY}^{\otimes n}) \to 0 \}.$

Theorem (Rényi CI for DSBS [Y.-Tan'20][Y.'24])

Let $P_{XY} = DSBS(\epsilon)$ with $\epsilon \in [0, 1/2]$. Then, for $q \in [0, \infty]$,

$$C_q = \begin{cases} 0, & q = 0\\ 1 + H(\epsilon) - 2H(a), & q \in (0, 1]\\ 1 - (1 + 2p^* - 2a)\log(1 - \epsilon) - (2a - 2p^*)\log\epsilon & & ,\\ -\frac{1 + s}{s}2H(a) + \frac{1}{s}H(p^*, a - p^*, a - p^*, 1 + p^* - 2a), & q \in (1, \infty)\\ 1 - (1 - 2a)\log(1 - \epsilon) - 2a\log\epsilon - 2H(a), & q = \infty \end{cases}$$

with
$$s = q - 1$$
, $a = \frac{1 - \sqrt{1 - 2\epsilon}}{2}$, $p^* = \frac{-1 + \sqrt{\kappa^2 (1 - 2a)^2 + 4\kappa a(1 - a)}}{2(\kappa - 1)} - (\frac{1}{2} - a)$,
 $\kappa = (\frac{1 - \epsilon}{\epsilon})^{2s}$, and $H(a_1, a_2, a_3, a_4) = -\sum_{i=1}^4 a_i \log a_i$.

Achievability: Typical codes, similar to Rényi resolvability problem.

Exact Common Information?

- What if we require $Q_{X^nY^n} = P_{XY}^{\otimes n}$ and the rate of W_n is measured by $\frac{1}{n}H(W_n)$ (variable-length coding)? [Kumar–Li–El Gamal'14]
- Exact common information:

$$C_{\text{Ex}} = \inf\{\frac{1}{n}H(W_n) : X^n \leftrightarrow W_n \leftrightarrow Y^n\}.$$

• A surprising equivalence:

Theorem ([Y.–Tan'20])

For P_{XY} on a finite alphabet,

$$C_{\mathrm{Ex}} = C_{\infty}.$$

| Loi Vu | (Nankai) |
|--------|-----------|
| Lei tu | (Nalikal) |

イロン イヨン イヨン -

Theorem ([Y.-Tan'20])

For a Gaussian source (X, Y) with correlation coefficient $\rho \in [0, 1)$, we have

$$\frac{1}{2}\log\left[\frac{1+\rho}{1-\rho}\right] \le C_{\infty} = C_{\text{Ex}} \le \frac{1}{2}\log\left[\frac{1+\rho}{1-\rho}\right] + \frac{\rho}{1+\rho}.$$
 (12)

- The lower bound is just Wyner's CI.
- We conjecture the upper bound is tight—still open!

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

5 Channel Simulation

Channel Simulation

$$X^n \sim \underbrace{P_X^{\otimes n}}_{W_n | X^n} \xrightarrow{W_n} \underbrace{P_{W_n | X^n}}_{\text{noiseless}} \underbrace{P_{Y^n | W_n}}_{P_{Y^n | W_n}} \xrightarrow{Y^n \sim P_{Y^n | X^n}}$$

By flipping $P_{X^n|W_n}$ to $P_{W_n|X^n}$, it is equivalent to the common information problem:

E

General Version (with Shared Randomness)

Goal: Ensure that

 $P_{X^nY^n} \approx P_{XY}^{\otimes n}$ (Approximate) or $P_{X^nY^n} = P_{XY}^{\otimes n}$ (Exact).

Equivalently,

$$P_{Y^n|X^n} \approx P_{Y|X}^{\otimes n}$$
 (Approximate) or $P_{Y^n|X^n} = P_{Y|X}^{\otimes n}$ (Exact).

General Version (with Shared Randomness)

- Known as reverse Shannon coding problem [Bennett et. al. '02], compression of sources of distributions [Winter '02], or distributed channel synthesis/simulation [Cuff '12].
- The solution for the TV-distance version was given by Cuff 2012.
- The solution for the TV-distance version in quantum setting was given by [Bennett et. al. '02][Bennett et. al. '14].
- The solution for exact channel simulation using fixed-length codes when $R_0 = \infty$ was given by [Cubitt et. al. '02].
- The solution for Rényi channel simulation using fixed-length codes when $R_0 = \infty$ was given by [Li–Li–Y. '24].
 - Interestingly, ∞ -Rényi simulation rate = exact simulation rate.
- Exact channel simulation using variable-length codes was studied by [Y.–Tan '20], and the solution for the DSBS was given.
 - Interestingly, ∞ -Rényi simulation rate = exact simulation rate.

・ロン ・四 と ・ 回 と ・ 回 と

Why simulation under Rényi divergences?

- ∞ -Rényi simulation \iff exact simulation.
- Rényi divergences ⇔ norms of a function.

Thank you!
